

The Bcfg2 Reporting System

Bcfg2's reporting system is its killer feature. It allows administrators to gain a broad understanding of the configuration state of their entire environment. It summarizes

- Configuration changes and when they were made
- Discrepancies between the specification and current client states
 - ◆ Clients can be grouped by misconfiguration type
- Configuration entries that are not specified
- Overall client summaries according to these types

There are two systems, the old system, which builds static reports based on a series of XSLT stylesheets and a new dynamic reporting system that uses django and a database backend.
